What the app covers

- Internal ATS workflows: jobs, candidates, applications, pipeline, interviews, clients, chat, admin permissions, analytics, and alerts.
- Public hiring intake: branded careers portal, role discovery, application submission, resume ingestion, and confirmation workflows.
- Match intelligence: deterministic No-AI scoring, hybrid AI rerank, JD profile extraction, and shortlist-oriented recruiter output.
- Operational support: recruiter copilot, workload monitoring, screening analytics, and audit-friendly workflow surfaces.

Broader App Summary And Feature Coverage

What it is

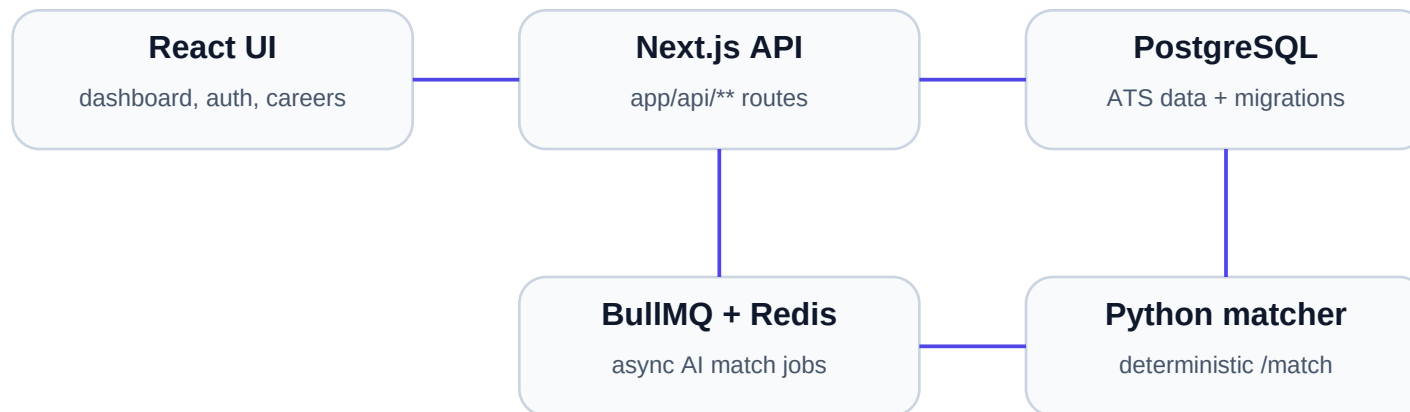

AASTHIX Talent is a Next.js-based applicant tracking and recruiting operations system backed by PostgreSQL. Beyond a standard ATS, the repo shows public careers intake, collaboration, analytics, screening workflows, and multiple match/evaluation paths.

Primary users

- Recruiters managing open roles, candidate sourcing, and shortlist movement.
- Admins overseeing permissions, invites, and wider system configuration.
- Hiring managers and coordinators participating in team-based visibility and interview flow.
- External applicants using the public careers portal to browse and apply.

Key capabilities

- Jobs and requisitions: create, update, filter, status-track, and publish openings through a shared jobs board.
- Talent management: searchable candidate database, candidate detail views, resume links, and application context.
- Pipeline execution: stage movement, interview coordination, SLA visibility, and shortlist operations.
- Analytics and insights: dashboard cards, funnel reporting, trend charts, screening analytics, and recruiter-focused summaries.
- Communication and governance: chat, activity center, audit views, admin permissions, and approval workflow modules.
- Match intelligence: JD extraction, match hub ranking, deterministic re-score, hybrid recompute, and recruiter copilot surfaces.

Data flow

- UI pages call JSON APIs and render recruiting workflows for admin and recruiter users.
- API handlers enforce auth and role/permission rules before reading or writing PostgreSQL data.
- Optional matching paths branch into Redis/BullMQ workers or the Python matcher service depending on the action selected.
- Public careers pages feed applicants back into the same ATS data model, alerts, and resume-processing pipeline.

Getting Started And Operating Notes

How to run

- Run npm install in the repo root.
- Create .env.local from .env.example and set DATABASE_URL, JWT_SECRET, and any SMTP/OpenAI-related values you need.
- Provision PostgreSQL and apply the SQL files under migrations/. A dedicated migration runner command was not found in the repo.
- Start the app with npm run dev and open the local URL.
- Use the built-in auth flows or test credentials to access admin and recruiter screens.

Optional services

- matcher-service: Python /match endpoint for deterministic No-AI scoring.
- Redis + BullMQ worker: queue-backed async analyze flow for larger AI matching runs.
- OpenAI/vector settings: enable higher-end matching and embeddings through env flags in .env.example.
- SMTP settings: support interview reminders and careers confirmation email flows.

Notes for this deck

- The screenshot pages were captured from the live local app using the provided admin credentials.
- The match-hub pages include visible output states after clicking Re-score (No AI) and Hybrid recompute.
- UI data can change over time because the views are backed by your live local database and current seeded/test content.

Welcome to AASTHIX Open Job Opportunities

Discover roles that match your craft — transparent JDs, a single secure application, and a direct line to our recruiting team.

 **About AASTHIX**

AASTHIX partners with enterprises to design, build, and run mission-critical technology programs. We value craft, ownership, and clarity — from how we scope work to how we grow teams. Our hiring process is built to respect your time: realistic job descriptions, structured interviews, and timely feedback at every step.

 Enterprise delivery mindset with product-grade engineering standards

 Transparent stages from application to offer

 Hybrid-friendly roles across key locations

 Data handled securely — no third-party form providers

Open positions

Only active roles with available headcount are listed.
